vignette PlasmodeSim

2022-10-19

Welcome to the vignette about the R package PlasmodeSim. This package is still under development.

installing plasmodeSim using remotes

To install using remotes run:

```
#install.packages("remotes")
remotes::install_github("GidiusVanDeKamp/PlasmodeSim")
```

```
## Skipping install of 'PlasmodeSim' from a github remote, the SHA1 (cfdcfd28) has not changed since la
## Use 'force = TRUE' to force installation
```

Setting up

This documents skips some parts, we have skipped the steps to obtain the plpResults and the plpData.

Example 1

In this example we obtain new outcomes of a fitted logistic model.

```
plpModelLog <- plpResultLogistic$model
probabilites <- PlasmodeSim::newPropsParametersPlpModel(plpModelLog, plpData, plpData$cohorts)

## Removing infrequent and redundant covariates and normalizing
## Removing infrequent and redundant covariates covariates and normalizing took 0.189 secs
## Prediction took 0.173 secs</pre>
```

The function predictPlp returned this information.

```
newOut <- PlasmodeSim::newOutcomes(200, probabilites)
head(newOut)</pre>
```

In the output of newOut patients are drawed randomly with the same chance, the patients could be drawed multiple times. If this happens they can have a different outcome. The function newOutcomes needs a data set where the column that contains the probabilities is called value.

Example 2

We here we show how to simulate new outcomes from an unfitted logistic model.

```
Parameters <- plpModelLog$model$coefficients
UnfittedParameters <- Parameters
UnfittedParameters[1,1] <- -0.4
UnfittedParameters[2:4,1] <- 0.4
head(UnfittedParameters)
```

```
## betas covariateIds
## 1 -0.4000 (Intercept)
## 2 0.4000 6003
## 3 0.4000 8003
## 4 0.4000 9003
## 5 0.0226 8507001
## 6 0.0000 28060210
```

For the logistic model it is necessary that the parameters are stored in a dataset with a column called betas and a column called covariateIds.

```
plpModelunfitted <- PlasmodeSim::makeLogisticModel(UnfittedParameters)
newprobs <- PatientLevelPrediction::predictPlp(plpModelunfitted, plpData,plpData$cohorts)
### Removing infrequent and redundant covariates and normalizing
### Removing infrequent and redundant covariates covariates and normalizing took 0.183 secs
### Prediction took 0.174 secs</pre>
```

```
newOut <- PlasmodeSim::newOutcomes(200, newprobs)
head(newOut)</pre>
```

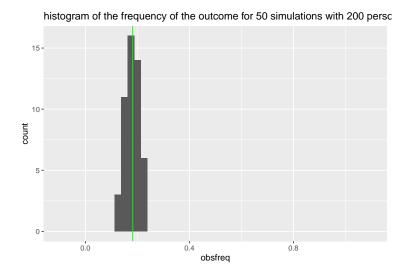

```
rowId newOutcomes
##
## 1 2413
                     1
## 2 2000
                     0
## 3 2024
                     0
## 4
     2287
                     1
## 5
     2543
                     0
## 6
      206
                     0
```

Visual simulations

The function visualOutcome simulated new data and then plots the frequency of the outcome. Right now the function visualOutcome only works for a logistic model. The green line in the plots is the average outcome in the original dataset.

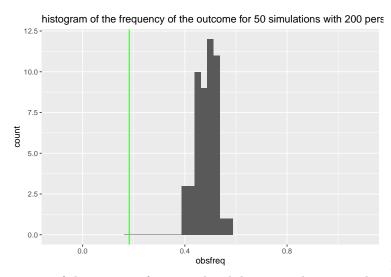

PlasmodeSim::visualOutcome(plpData,50,200,Parameters)

Removing infrequent and redundant covariates and normalizing
Removing infrequent and redundant covariates covariates and normalizing took 0.176 secs
Prediction took 0.171 secs

PlasmodeSim::visualOutcome(plpData,50,200,UnfittedParameters)

Removing infrequent and redundant covariates and normalizing
Removing infrequent and redundant covariates covariates and normalizing took 0.178 secs
Prediction took 0.173 secs

Here we have plotted 50 times the fre-

quency of the outcome for a simulated dataset with 200 people.

Visual of a specific covariate

covariateIdToStudy<- plpResultLogistic\$covariateSummary\$covariateId[3]
UnfittedParameters[3,]</pre>

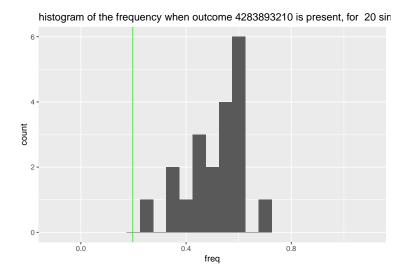

betas covariateIds
3 0.4 8003

PlasmodeSim::visualOutcomeCovariateId(plpData, covariateIdToStudy, 20, 200, UnfittedParameters)

Removing infrequent and redundant covariates and normalizing

Removing infrequent and redundant covariates covariates and normalizing took 0.18 secs

Prediction took 0.176 secs

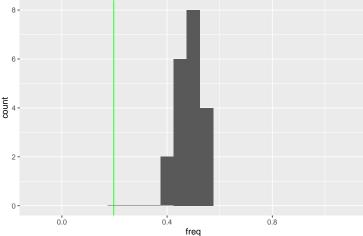

PlasmodeSim::visualOutcomeCovariateId2(plpData, covariateIdToStudy, 20, 200, UnfittedParameters)

Removing infrequent and redundant covariates and normalizing

Removing infrequent and redundant covariates covariates and normalizing took 0.17 secs

Prediction took 0.175 secs

histogram of the frequency when outcome 4283893210 is present, for 20 sin

As one can see visualOutcomeCovariateId and visualOutcomeCovariateId2 are very similiar, they both calculate and plot the frequency for a group with a specific covariate present. The small difference is that visualOutcomeCovariateId filters a newly simulated dataset set to only keep the patients where the covariate is present, and visualOutcomeCovariateId2 only simulates new outcomes for patients that have the covariate present. We see they are almost the identical only visualOutcomeCovariateId2 is spread out less because the groups for calculating the frequency with are bigger.

survival times outcomes.

For simulating new survival times we need more than one probability, we use the baselinehazard, stored in the plpModel.

```
modelSettings <- PatientLevelPrediction::setCoxModel()
plpResult <- PatientLevelPrediction::loadPlpResult("~/R/internshipErasmusMC/simulate-new-patients-outcomplpModel<- plpResult$model</pre>
```

simulation censored survival data

first we have to set some settings.

```
populationSettings <- PatientLevelPrediction::createStudyPopulationSettings(
 binary = TRUE,
  includeAllOutcomes = FALSE,
  firstExposureOnly = FALSE,
  washoutPeriod = 180,
  removeSubjectsWithPriorOutcome = FALSE,
  priorOutcomeLookback = 99999,
 requireTimeAtRisk = TRUE,
  minTimeAtRisk = 1,
 riskWindowStart = 1,
  startAnchor = 'cohort start',
 riskWindowEnd = 7300,
  endAnchor = 'cohort start'
)
executeSettings <- PatientLevelPrediction::createExecuteSettings(</pre>
  runSplitData = TRUE,
 runSampleData = FALSE,
 runfeatureEngineering = FALSE,
 runPreprocessData = TRUE,
  runModelDevelopment = TRUE,
  runCovariateSummary = TRUE
)
splitSettings <- PatientLevelPrediction::createDefaultSplitSetting(</pre>
  testFraction = 0.25,
 trainFraction = 0.75,
 splitSeed = 123,
 nfold = 3,
 type = 'stratified'
sampleSettings <- PatientLevelPrediction::createSampleSettings(</pre>
  type = 'none'
```

```
featureEngineeringSettings <- PatientLevelPrediction::createFeatureEngineeringSettings(
  type = 'none'
preprocessSettings <- PatientLevelPrediction::createPreprocessSettings(</pre>
  minFraction = 0,
  normalize = TRUE,
 removeRedundancy = TRUE
modelSettings <- PatientLevelPrediction::setCoxModel()</pre>
now that we have out settings. We define a training set and fit the model. The model acctually consist of
two plpModels stored in a list.
```

TrainingSet <- PlasmodeSim::MakeTraingSet(plpData, executeSettings, populationSettings, splitSettings,</pre> ## Outcome is 0 or 1 ## seed: 123 ## Creating a 25% test and 75% train (into 3 folds) random stratified split by class ## Data split into 656 test cases and 1974 train cases (658, 658, 658) ## Train Set: ## Fold 1 658 patients with 120 outcomes - Fold 2 658 patients with 120 outcomes - Fold 3 658 patients ## 103 covariates in train data ## Test Set: ## 656 patients with 119 outcomes ## Removing 2 redundant covariates ## Normalizing covariates ## Tidying covariates took 0.502 secs ## Train Set: ## Fold 1 658 patients with 120 outcomes - Fold 2 658 patients with 120 outcomes - Fold 3 658 patients ## 101 covariates in train data ## Test Set: ## 656 patients with 119 outcomes fitcensor<- PlasmodeSim::fitCensoring(TrainingSet\$Train, modelSettings)</pre> ## Running Cyclops ## Done. ## GLM fit status: OK ## Creating variable importance data frame ## Prediction took 0.133 secs ## Running Cyclops ## Done. ## GLM fit status: OK ## Creating variable importance data frame ## Prediction took 0.136 secs NewOutcomes <- PlasmodeSim::simulateWithCensoring(fitcensor, plpData, populationSettings, 20) ## Outcome is 0 or 1 ## Removing infrequent and redundant covariates and normalizing

```
## Removing infrequent and redundant covariates covariates and normalizing took 0.183 secs
```

```
## Prediction took 0.261 secs
```

- ## Removing infrequent and redundant covariates and normalizing
- ## Removing infrequent and redundant covariates covariates and normalizing took 0.169 secs
- ## Prediction took 0.264 secs
